

Understanding a study

Original reading example - not empirical findings

01 Read beyond the headline result

A higher score alone does not prove a better method.

Separate the observation, the conditions and the explanation.

Mark an unfamiliar idea, then follow the evidence behind it.

02 Turn a claim into questions you can check

Observation	What was actually reported?
Conditions	Are the data and comparisons appropriate?
Uncertainty	Is the result stable across repeated runs?
Scope	Where would the conclusion apply?

03 Keep a route back to the source

Source question > Explanation > Conditions and limits

Illustrates a reading workflow; not an evaluation of the app or a study.
